

BetterNode Outline

Clients provide 32 ethers and BetterNode spins up and maintains a validator in the name of the client. Dividend yields are sent to the clients Income Wallets, which they can access through their investor portal

When the eth held cumulatively in the income wallets reaches 32 we open up a new family validator with the funds in order to return the highest APY possible. This new validator begins warehousing the eth from the income wallets in the node and begins paying out its own dividends back to the income wallets proportional to the wallets contributed share.

The family validator unlocks compounding earning potential for clients of BetterNode. As we move forward into the middle & late 2020s those who participated very early on in ethereum staking will be heavily rewarded, and those who join BetterNode more so.
